Patterns in F#

Functions of a single parameter

Patterns in F#

Variables

Tuples

Literals

Strings

Guard statements

Constants

Lists of Patterns

:: of Patterns

Tuples

Summary

Exercises

Patterns Everywhere

Pattern Examples

Guards

Exercises

Local Vars

Sorting Example

Example

```
> let f1 n = n*n;;  
val f1 : n:int -> int  
> f1 3;;  
val it : int = 9
```

- `n` matches and *binds* to any single `int` argument.
- `f1 3` binds `n` to `3`.

A tuples parameter

Patterns in F#

Variables

Tuples

Literals

Strings

Guard statements

Constants

Lists of Patterns

:: of Patterns

Tuples

Summary

Exercises

Patterns Everywhere

Pattern Examples

Guards

Exercises

Local Vars

Sorting

Example

Example

```
> let f2 (a, b) = a*b;;  
val f2 : (a:int * b:int) -> int  
> f2 (3,4);;  
val it : int = 12  
> f2 4 5;;  
error FS0003: This value is not a function and  
cannot be applied
```

- (a, b) matches and binds a and b any 2-tuple int argument.
- `f2 (3, 4)` binds a to 3 and b to 4.

Pattern-Matching Literal Values

Patterns in F#

Variables

Tuples

Literals

Strings

Guard statements

Constants

Lists of Patterns

:: of Patterns

Tuples

Summary

Exercises

Patterns Everywhere

Pattern Examples

Guards

Exercises

Local Vars

Sorting

Example

Example

```
> let printRole role =  
    match role with  
        | "admin" -> printfn "Administrator"  
        | "user" -> printfn "User";;  
val printRole : role:string -> unit  
  
> printRole "user";;  
User
```

- Note indentation of **match** and | lines

_ as a Pattern

Example

```
> let printRole role =  
    match role with  
    | "admin" -> printfn "Administrator"  
    | "user" -> printfn "User"  
    | _ -> printfn "Unknown User";;  
val printRole : role:string -> unit  
  
> printRole "hacker";;  
Unknown User
```

- When no match in a match expression, throws exception.
- The underscore pattern matches any string argument.

Summary

Exercises

Patterns Everywhere

Pattern Examples

Guards

Exercises

Local Vars

Sorting

Example

Example

```
> let f x =  
    match x with  
        | 0 -> "x == 0";;  
val f : x:int -> string  
> f 0;;  
val it : string = "x == 0"
```

- Note the function returns a string result
- The type of f is `x:int -> string`

Guard statements

Constants

Lists of Patterns

:: of Patterns

Tuples

Summary

Exercises

Patterns Everywhere

Pattern Examples

Guards

Exercises

Local Vars

Sorting

Example

- Single variable matches and binds to anything
- `_` matches anything but binds to nothing
- Constant (of an equality type) matches only that constant
- Guards can be added with the `when` keyword
- Tuple of patterns matches any tuple of the right size, whose contents match the sub-patterns
- List of patterns matches any list of the right size, whose contents match the sub-patterns
- Cons (`::`) of patterns matches any non-empty list whose head and tail match the sub-patterns

Local Vars

Sorting Example

Example

```
> let (a,b) = (1,2.3);;  
val b : float = 2.3  
val a : int = 1
```

```
> let a::b = [1;2;3;4;5];;  
val b : list = [2;3;4;5]  
val a : int = 1
```

- Hallmarks of functional languages:
 - Patterns are not just for match
 - Here we see that you can use them in a **let** assignment
 - More ways to use patterns, later

Factorial with Patterns

Patterns in F#

- Exercises

Local Vars

- Sorting
- Example

Example (Sum)

```
let rec sum L =  
    match L with  
    | [] -> 0  
    | h::t -> h + sum t;;
```

Example (Count true's)

```
let rec count L =  
    match L with  
    | [] -> 0  
    | true::t -> 1 + count(t)  
    | false::t -> count(t);;
```

Increment list values by 1

Example

```
let rec f L =  
    if L = [] then []  
    else (L.Head+1) :: f L.Tail;;
```

Example

```
let rec f L =  
    match L with  
    | [] -> []  
    | h::t -> h+1 :: f(t);;
```

Local Vars

Sorting Example

Translate into patterns

```
let rec snoc a (L : 'a list) =  
    if L.IsEmpty then [a]  
    else L.Head::snoc a L.Tail;;
```

```
let rec rac (L : 'a list) =  
    if L.Tail.IsEmpty then L.Head  
    else rac L.Tail;;
```

```
let rec rdc (L : 'a list) =  
    if L.Tail.IsEmpty then []  
    else L.Head::rdc(L.Tail);;
```

Local Vars

Definitions

Long Expressions with
in

Debugging

Exp time

Linear Time

Patterns with in

Sorting
Example

Local Vars

Local Variable Definitions

Patterns in F#

Local Vars

Definitions

Long Expressions with
in

Debugging

Exp time

Linear Time

Patterns with in

Sorting
Example

Example

```
let f x =  
    let y = 2  
    in  
    x+y;;
```

- For readability, use multiple lines and indent function expressions like this
- The variable **y** has only the scope of function **f**

Functional Languages

Example

```
> let days2ms days =  
    let hours = days * 24.0  
    let minutes = hours * 60.0  
    let seconds = minutes * 60.0  
    in  
    seconds * 1000.0;;  
val days2ms : days:float -> float  
> days2ms 10.0;;  
val it : float = 864000000.0
```

- The `in` keyword allows you to break up long expressions and name the pieces
- This can make code more readable

Debugging with let...in

Patterns in F#

Local Vars

Definitions

Long Expressions with
in

Debugging

Exp time

Linear Time

Patterns with in

Sorting

Example

Example

```
let rec fac n =  
    match n with  
    | 0 | 1 -> 1  
    | n ->  
        let _ = printfn "%d" n  
        in  
        n * fac(n-1);;
```

- Notice the newline and indentation
- `let _ = ...` binds the unit result of **printfn** to nothing
- Returns the value `n * fac(n-1)`

Exponential time trace

Patterns in F#

Local Vars

Definitions

Long Expressions with
in

Debugging

Exp time

Linear Time

Patterns with in

Sorting
Example

Example

```
let rec fib n =  
  match n with  
  | 0 | 1 -> 1  
  | n -> fib (n-1) + fib (n-2);;
```

Patterns with linear time

Definitions

Long Expressions with
in

Debugging

Exp time

Linear Time

Patterns with in

Sorting
Example

Example

```
let rec fib n =  
    match n with  
    | 0 -> (1, 0)  
    | 1 -> (1, 1)  
    | 2 -> (2, 1)  
    | n ->  
        let (a, b) = fib (n-1)  
        in  
        (a+b, a);;
```

What is the trace for fib 4?

Patterns with in

- Cases more clearly stated with patterns than conditionals.
- Patterns with **let...in** can improve program readability.
- The **halve** function divides a list into two lists as a tuple.
- **halve [1;2;3;4;5]** returns **([1;3;5],[2;4])**
- **fst (halve cs)** is first element of tuple **halve(cs)**
- Recall that **fst ([1;3;5],[2;4])** is **[1;3;5]**.

Example

```
let rec halve L =  
  match L with  
  | [] -> ([], [])  
  | h::[] -> ([h], [])  
  | a::b::cs ->  
    (a::fst (halve cs), b::snd (halve cs));;
```

With let...in

Patterns in F#

Local Vars

Definitions

Long Expressions with
in

Debugging

Exp time

Linear Time

Patterns with in

Sorting
Example

Example

```
let rec halve L =  
  match L with  
  | [] -> ([], [])  
  | a::[] -> ([a], [])  
  | a::b::cs ->  
    let (x, y) = halve(cs)  
    in  
    (a::x, b::y);;
```

- Runs in linear time instead of exponential time
- Pattern matching usually gives a better solution

Sorting Example

Merge Sort

Patterns in F#

Local Vars

Sorting
Example

Merge Sort

The Merge

Merge At Work

Merge Trace

mergeSort

mergeSort Example

Nested mergeSort

- The halve function divides a list into two nearly-equal parts
- This is the first step in a merge sort
- For practice, we will look at the rest

The Merge

Patterns in F#

Local Vars

Sorting
Example

Merge Sort

The Merge

Merge At Work

Merge Trace

mergeSort

mergeSort Example

Nested mergeSort

Example

```
let rec merge (L:int list * int list) =  
  match L with  
  | ([], ys) -> ys  
  | (xs, []) -> xs  
  | (x::xs, y::ys) when x < y ->  
    x::merge (xs, y::ys)  
  | (x::xs, y::ys) -> y::merge (x::xs, ys);;
```

- Merges two *sorted* lists

Merge At Work

Patterns in F#

Local Vars

Sorting
Example

Merge Sort

The Merge

Merge At Work

Merge Trace

mergeSort

mergeSort Example

Nested mergeSort

Example

```
> merge ([2], [1;3]);;  
val it : int list = [1; 2; 3]
```

```
> merge ([1;3;4;7;8], [2;3;5;6]);;  
val it : int list = [1; 2; 3; 3; 4; 5; 6; 7; 8]
```

Merge Trace

Patterns in F#

Local Vars

Sorting
Example

Merge Sort

The Merge

Merge At Work

Merge Trace

mergeSort

mergeSort Example

Nested mergeSort

Example

```
let rec merge (L:int list * int list) =
  let _ = printfn "L=%A" L
  in
  match L with
  | ([], ys) -> ys
  | (xs, []) -> xs
  | (x::xs, y::ys) when x < y ->
    x::merge (xs, y::ys)
  | (x::xs, y::ys) -> y::merge (x::xs, ys);;

> merge ([1;3;4], [2;3;5]);;
L=([1; 3; 4], [2; 3; 5])
L=([3; 4], [2; 3; 5])
L=([3; 4], [3; 5])
L=([3; 4], [5])
L=([4], [5])
L=([], [5])
val it : int list = [1; 2; 3; 3; 4; 5]
```

mergeSort

Patterns in F#

Local Vars

Sorting
Example

Merge Sort

The Merge

Merge At Work

Merge Trace

mergeSort

mergeSort Example

Nested mergeSort

Example

```
let rec mergeSort L =  
    match L with  
    | [] -> []  
    | a::[] -> [a]  
    | theList ->  
        let (x, y) = halve theList  
        in  
        merge (mergeSort x, mergeSort y);;
```

- Merge sort of a list
- Type is `mergeSort : L:int list -> int list`

mergeSort Example

Patterns in F#

Local Vars

Sorting
Example

Merge Sort

The Merge

Merge At Work

Merge Trace

mergeSort

mergeSort Example

Nested mergeSort

Example

```
> mergeSort [6;3;4;1;7];;  
L=([6], [7])  
L=([], [7])  
L=([6; 7], [4])  
L=([6; 7], [])  
L=([3], [1])  
L=([3], [])  
L=([4; 6; 7], [1; 3])  
L=([4; 6; 7], [3])  
L=([4; 6; 7], [])  
val it : int list = [1; 3; 4; 6; 7]
```

- Runtime is $O(n \lg n)$
- n operations at each list size
- List is cut in half $\lg n$ times before reaching a base case

Nested mergeSort

Patterns in F#

Local Vars

Sorting
Example

Merge Sort

The Merge

Merge At Work

Merge Trace

mergeSort

mergeSort Example

Nested mergeSort

Example

```
let rec mergeSort L =
    match L with
    | [] -> []
    | _::[] -> L
    | theList ->
        let rec halve L =
            match L with
            | [] -> ([], [])
            | a::[] -> ([a], [])
            | a::b::cs ->
                let (x, y) = halve cs
                (a::x, b::y)
        let rec merge (L1, L2) =
            match (L1, L2) with
            | ([], ys) -> ys
            | (xs, []) -> xs
            | (x::xs, y::ys) when x<y -> x::merge(xs,y::ys)
            | (x::xs, y::ys) -> y::merge(x::xs,ys)
        let (x, y) = halve theList
        in
        merge (mergeSort x, mergeSort y);;
```
