Tail Recursion and Continuations

- Three important predefined higher-order functions:
 - `List.map`
 - `List.fold`
 - `List.foldBack`
- `List.fold` and `List.foldBack` are similar – not identical
- Defined for `List` module
- <https://fsharp.github.io/fsharp-core-docs/reference/fsharp-collections-listmodule.html>

The map Function

Higher order functions

Predefined Functions

The map Function

Exercise

The foldBack Function

foldBack Examples

The fold Function

fold Functionality

fold Functions

fold Comparisons

Exercises

Tail Recursion and Continuations

Example

```
> List.map (fun i -> -i) [1;2;3];;  
val it : int list = [-1; -2; -3]
```

```
> List.map (fun x -> x+1) [1;2;3];;  
val it : int list = [2; 3; 4]
```

```
> List.map (fun (a,b) -> a+b) [(1,2); (3,4)];;  
val it : int list = [3; 7]
```

```
> List.map (fun i -> i*2) [1..5];;  
val it : int list = [2; 4; 6; 8; 10]
```

- Apply *unary* function to every element of a List, and collect a list of results

Exercises

Tail Recursion and Continuations

What are the results?

```
List.map (fun x -> x*x) [1;2;3];;
```

```
List.map (fun x -> if x<0 then -x else x) [-1;0;1];;
```

```
List.map (fun x -> ("A", x)) [1;2;3];;
```

```
let f a L = List.map (fun x -> (a, x)) L;;  
f "A" [1;2;3];;
```

The foldBack Function

Higher order functions

Predefined Functions

The map Function

Exercise

The foldBack Function

foldBack Examples

The fold Function

fold Functionality

fold Functions

fold Comparisons

Exercises

Tail Recursion and Continuations

- Very similar to our foldback
- Used to combine all the elements of a list
- Given binary function f , a starting value c , and a list $x = x_1 \dots x_n$:
 $f(x_1, f(x_2, \dots f(x_{n-1}, f(x_n, c)) \dots))$

Example

```
> List.foldBack (fun a b -> a+b) [1;2;3] 0;;  
val it : int = 6 // calculates 1+(2+(3+0))
```

foldBack Examples

The map Function

Exercise

The foldBack Function

foldBack Examples

The fold Function

fold Functionality

fold Functions

fold Comparisons

Exercises

Tail Recursion and Continuations

Example

```
> List.foldBack (fun x c -> x-c) [1;2;3;4] 0;;
val it : int = -2 // (1-(2-(3-(4-0))))
> List.foldBack (fun x c -> if x<c then x else c)
  [4;2;8;5] 9999;;
val it : int = 2 // min function
> List.foldBack (fun x c -> x::c) [1;2;3] [10];;
int list = [1; 2; 3; 10] // 1::(2::(3::[10]))
```

$$\blacksquare f(x_1, f(x_2, \dots, f(x_{n-1}, f(x_n, c)) \dots))$$

The fold Function

Higher order functions

Predefined Functions

The map Function

Exercise

The foldBack Function

foldBack Examples

The fold Function

fold Functionality

fold Functions

fold Comparisons

Exercises

Tail Recursion and Continuations

Example

```
> List.fold (fun c x -> x+c) 0 [1;2;3];;  
val it : int = 6
```

```
> List.fold (fun c x -> x*c) 1 [1;2;3;4];;  
val it : int = 24
```

- Used to combine all the elements of a list
- Same results as `List.foldBack` in certain cases
- Note base case c and List elements x are switched

fold Functionality

Higher order functions

Predefined Functions

The map Function

Exercise

The foldBack Function

foldBack Examples

The fold Function

fold Functionality

fold Functions

fold Comparisons

Exercises

Tail Recursion and Continuations

Example

```
> List.fold (fun c x -> x+c) 0 [1;2;3];;  
val it : int = 6 // evaluates as ((0+1)+2)+3 = 6
```

- Takes a function f , a starting value c , list $x = (x_1, \dots, x_n)$ and computes:
 - $f(f(\dots f(f(c, x_1), x_2) \dots, x_{n-1}), x_n)$
 - Remember, `List.foldBack` calculated $1 + (2 + (3 + 0)) = 6$

fold Functions

fold Functions

fold Comparisons

Exercises

Tail Recursion and Continuations

- fold starts at the left, foldBack starts at the right
- Difference does not matter when the function is associative and commutative, like + and *
- For other operations, such as - or /, order matters

Example

```
> List.fold (fun x c -> x-c) 0 [1;2;3];;  
val it : int = -6 // ((0-1)-2)-3  
> List.foldBack (fun x c -> x-c) [1;2;3] 0;;  
val it : int = 2 // 1-(2-(3-0))
```

fold Comparisons

fold Functions

fold Comparisons

Exercises

Tail Recursion and Continuations

Example

```
> let cons a L = a::L;;
```

```
> let L = [];;
```

```
> List.foldBack (fun x c -> cons x c) [1;2;3] L;;
```

```
val it : int list = [1; 2; 3]
```

```
// cons (1, cons(2, cons(3, [])))
```

```
> List.fold (fun c x -> cons x c) L [1;2;3];;
```

```
val it : int list = [3; 2; 1]
```

```
// cons (3, cons(2, cons(1, [])))
```

Exercises

- fold: $f(f(\dots f(f(c, x_1), x_2) \dots, x_{n-1}), x_n)$
- foldBack: $f(x_1, f(x_2, \dots f(x_{n-1}, f(x_n, c)) \dots))$

Evaluate

```
List.foldBack (fun x c -> x/c) [128;16;4] 1;;
```

```
List.fold (fun c x -> x/c) 1 [128;16;4];;
```

```
List.fold (fun c x -> x::c) [] [1;2;3;4];;
```

```
List.fold  
  (fun c x -> List.map (fun a -> a*a) (x::c))  
  [] [1;2;3;4];;
```

```
let f L = List.fold (fun c x -> x::c) [] L;;  
f [(1, "A"); (2, "B"); (3, "C"); (4, "D")];;
```

Exercises

Tail Recursion and Continuations

Evaluate

```
let reverse (s:string) =
    new string(Array.rev (s.ToCharArray()));;
let toUpper (s: string) = s.ToUpper();;
let appendBar (s: string) = s + "bar";;

appendBar (toUpper (reverse "Foo"));; //OOFbar
reverse (toUpper (appendBar "Foo"));; //RABOOF

List.fold (fun c xf -> (xf c)) "foo"
    [reverse; toUpper; appendBar];;

List.foldBack (fun xf c -> (xf c))
    [reverse; toUpper; appendBar] "foo";;
```

Tail Recursion and Continuations

Tail recursion

A function call is tail recursive if there is nothing to do after the function returns except return its value.

Example (Not tail recursive)

```
> let rec factorial n =  
    match n with  
    | 1 -> 1  
    | n -> factorial (n-1) * n;;
```

Example (Tail recursive)

```
> let rec tailFact a n =  
    match n with  
    | 1 -> a  
    | n -> tailFact (a*n) (n-1);;
```

Tail recursion

Higher order
functions

Tail Recursion
and
Continuations

Tail recursion

Equivalent factorial

Exercises

Exercise Solution

Tail recursion problem

Using Iteration

- Non-tail recursion accumulates returned results after recursion.
- Tail recursion accumulates results before recursion.

Equivalent factorial

Example

```
> let rec tailFact a n =  
    match n with  
    | 1 -> a  
    | n -> tailFact (a*n) (n-1);;  
  
> let factorial n = tailFact 1 n;;  
  
> let factorial (n:int):int =  
    let rec tailFact a n =  
        match n with  
        | 1 -> a  
        | n -> tailFact (a*n) (n-1)  
    in  
    tailFact 1 n;;
```

Exercises

Higher order
functions

Tail Recursion
and
Continuations

Tail recursion

Equivalent factorial

Exercises

Exercise Solution

Tail recursion problem

Using Iteration

Convert to tail-recursive

```
let rec sum L =  
  match L with  
  | [] -> 0  
  | h::t -> h+(sum t);;
```

Convert to tail-recursive

```
let rec rdc L =  
  match L with  
  | h::[] -> []  
  | h::t -> h::rdc t;;
```

Exercise Solution

Higher order
functions

Tail Recursion
and
Continuations

Tail recursion

Equivalent factorial

Exercises

Exercise Solution

Tail recursion problem

Using Iteration

Example

```
let rec sumTail a L =  
  match L with  
  | [] -> a  
  | h::t -> sumTail (a+h) t;;
```

Example

```
let rec rdcTail a L =  
  match L with  
  | h::[] -> a  
  | h::t -> rdcTail (h::a) t;;
```

Do rdc and rdcTail work the same?

Tail recursion problem

Higher order
functions

Tail Recursion
and
Continuations

Tail recursion

Equivalent factorial

Exercises

Exercise Solution

Tail recursion problem

Using Iteration

Example

```
let rec id L =
  match L with
  | [] -> []
  | h::t -> h::id t;;

let rec idTail a L =
  match L with
  | [] -> a
  | h::t -> idTail (h::a) t;;

id [1;2;3;4];; // 1::2::3::4::[]
idTail [] [1;2;3;4];; // 4::3::2::1::[]
```

- Tail recursive but `::` is not associative – results are in reverse order.

Using Iteration

Higher order
functions

Tail Recursion
and
Continuations

Tail recursion

Equivalent factorial

Exercises

Exercise Solution

Tail recursion problem

Using Iteration

FACT(*int n*)

```
1: if n=1 then  
2:   fact ← 1  
3: else  
4:   fact ← FACT(n-1) * n
```

FACTORIAL_ITERATIVE(*int n*)

```
1: int factorial ← 1  
2: while n ≠ 1 do  
3:   factorial ← factorial * n  
4:   n ← n - 1
```

- change *if* to *while*
- change while test to the **not** of *if* test (De Morgan's Laws)
- change recursive call to assignment statement that modifies value of variable controlling *while* loop
